# **Revision History**

| Revision | Date       | Description  |
|----------|------------|--|
| 1.0      | 03/21/2005 | First release  |
| 1.50     | 04/21/2005 | 1. Modify GREEN1~4 and AMBER1~4, Ch. 3.3, p.11 2. Add MaxPower Describe, Ch. 5.2.5, p.20 3. Add Ch.6.4 –Power Consumption, p.23  |
| 1.51     | 04/25/2005 | Modify "MaxPoer" to "MaxPower", table 5.1, p.20  |
| 1.52     | 04/26/2005 | Modify Table3.3 Pin Descriptions(PSELF),p.11   |
| 1.60     | 06/20/2005 | Modify Table 8.1 Ordering Information,p27  |
| 1.61     | 07/07/2005 | 1. Modify pin#46 ,pin#36 ,GL850A 48pin Pinout, Ch3.1,p.9 2. Modify pin#61 ,pin#49 ,GL850A 64pin Pinout Ch3.1,p.10 3. Add Pin name "EE_CS/EE_DI", Hub Interface,table3.4, p.12 4. Modify Fosc ,table 6.1- Maximum Ratings,p.24 5. Modify Vcc ,table 6.2 – Operating Ranges,p.24 |
| 1.62     | 09/07/2005 | Modify Pin Descriptions ,table3.3 ,p.12  |
| 1.63     | 09/15/2005 | Modify HUB Interface ,table3.3 Pin Description, p.13   |
| 1.64     | 12/28/2005 | Modify Pin List and Pin Descriptions of EE_CS, EE_DI, EE_SK, p.11~12   |
| 1.65     | 03/29/2006 | Add Input Voltage for digital I/O(Ovcur1-4,Pself,Reset) pins,p.24  |
| 1.66     | 11/03/2006 | Modify 93C46 Configuration, Table 5.1, p.22  |
| 1.67     | 01/17/2007 | Modify Table 6.1-Maximum Ratings, p.24   |
| 1.68     | 03/12/2007 | Modify RESET# Setting, Ch5.2.1, p.18   |
| 1.69     | 07/19/2007 | Modify PGANG/SUSPND Setting, Ch5.2.2, p.19   |

#### CHAPTER 1 GENERAL DESCRIPTION

GL850A is Genesys Logic's advanced version Hub solutions which fully comply with Universal Serial Bus Specification Revision 2.0.

GL850A embeds an 8-bit RISC processor to manipulate the control/status registers and respond to the requests from USB host. Firmware of GL850A will control its general purpose I/O (GPIO) to access the external EEPROM and then respond to the host the customized PID and VID configured in the external EEPROM. Default settings in the internal mask ROM is responded to the host without having external EEROM. GL850A is designed for customers with much flexibility. The more complicated settings such as PID, VID, and number of downstream ports settings are easily achieved by programming the external EEPROM (Ref. to Chapter 5).

Each downstream port of GL850A supports two-color (green/amber) status LEDs to indicate normal/abnormal status. GL850A also support both Individual and Gang modes (4 ports as a group) for power management. The GL850A (64-pin) is a full function solution which supports both Individual/Gang power management modes and the two-color (green/amber) status LEDs. The low pin-count version GL850A (48-pin) only supports Gang mode. Please refer the table in the end of this chapter for more detail.

To fully meet the cost/performance requirement, GL850A is a single TT hub solution for the cost requirement. Genesys Logic also provides GL852 for multiple TT hub solution to target on systems which require higher performance for full/low-speed devices, like docking station, embedded system ... etc.. Please refer to GL852 datasheet for more detailed information.

\*TT (transaction translator) is the main traffic control engine in an USB 2.0 hub to handle the unbalanced traffic speed between the upstream port and the downstream ports.

| Product Name | Package type | Power mode      | LED support |  |
|--------------|--------------|-----------------|-------------|--|
| GL850A       | 64LQFP       | Individual/Gang | Green/Amber |  |
| GL850A       | 48LQFP       | Gang            | Green/Amber |  |

#### CHAPTER 2 FEATURES

- Compliant to USB specification Revision 2.0
  - 4 downstream ports
  - Upstream port supports both high-speed (HS) and full-speed (FS) traffic
  - Downstream ports support HS, FS, and low-speed (LS) traffic
  - 1 control pipe (endpoint 0, 64-byte data payload) and 1 interrupt pipe (endpoint 1, 1-byte data payload)
  - Backward compatible to USB specification Revision 1.1
- On-chip 8-bit micro-processor
  - RISC-like architecture
  - USB optimized instruction set
  - Dual cycle instruction execution
  - Performance: 6 MIPS @ 12MHz
  - With 64-byte RAM and 2K internal ROM
  - Support customized PID, VID by reading external EEPROM
  - Support downstream port configuration by reading external EEPROM
- Single Transaction Translator (STT)
  - Single TT shares the same TT control logics for all downstream port devices. This is the most cost
    effective solution for TT. Multiple TT provides individual TT control logics for each downstream port.
    This is a performance better choice for USB 2.0 hub. Please refer to GL852 datasheet for more
    detailed information.
- Each downstream port supports two-color status indicator, with automatic and manual modes compliant to USB specification Revision 2.0
- Support both individual and gang modes of power management and over-current detection for downstream ports (64-pin LQFP)
- Support gang mode of power management and over-current detection for downstream ports
- Conform to bus power requirements
- Automatic switching between self-powered and bus-powered modes
- Integrate USB 2.0 transceiver
- PLL embedded with external 12 MHz crystal
- Operate on 3.3 Volts
- Embed serial resister for USB signals and integrate pull-up resister for upstream USB signal
- Improve output drivers with slew-rate control for EMI reduction
- Internal power-fail detection for ESD recovery
- 64/48-pin LQFP package
- Applications:
  - Stand-alone USB hub
  - PC motherboard USB hub, Docking of notebook
  - Any compound device to support USB HUB function

## **CHAPTER 3 PIN ASSIGNMENT**

#### 3.1 Pinouts

# CHAPTER 4 BLOCK DIAGRAM

Figure 4.1 – GL850A Block Diagram (single TT)

#### CHAPTER 5 FUNCTION DESCRIPTION

#### 5.1 General

#### **5.1.1 USPORT Transceiver**

USPORT (upstream port) transceiver is the analog circuit that supports both full-speed and high-speed electrical characteristics defined in chapter 7 of *USB specification Revision 2.0*. USPORT transceiver will operate in full-speed electrical signaling when GL850A is plugged into a 1.1 host/hub. USPORT transceiver will operate in high-speed electrical signaling when GL850A is plugged into a 2.0 host/hub.

#### **5.1.2 PLL (Phase Lock Loop)**

GL850A contains a 40x PLL. PLL generates the clock sources for the whole chip. The generated clocks are proven quite accurate that help in generating high speed signal without jitter.

#### **5.1.3 FRTIMER**

This module implements hub (micro)frame timer. The (micro)frame timer is derived from the hub's local clock and is synchronized to the host (micro)frame period by the host generated Start of (micro)frame (SOF). FRTIMER keeps tracking the host's SOF such that GL850A is always safely synchronized to the host. The functionality of FRTIMER is described in section 11.2 of *USB Specification Revision 2.0*.

#### 5.1.4 μC

 $\mu C$  is the micro-processor unit of GL850A. It is an 8-bit RISC processor with 2K ROM and 64 bytes RAM. It operates at 6MIPS of 12Mhz clock to decode the USB command issued from host and then prepares the data to respond to the host. In addition,  $\mu C$  can handle GPIO (general purpose I/O) settings and reading content of EEPROM to support high flexibility for customers of different configurations of hub. These configurations include self/bus power mode setting, individual/gang mode setting, downstream port number setting, device removable/non-removable setting, and PID/VID setting.

#### **5.1.5 UTMI (USB 2.0 Transceiver Macrocell Interface)**

UTMI handles the low level USB protocol and signaling. It's designed based on the Intel's UTMI specification 1.01. The major functions of UTMI logic are to handle the data and clock recovery, NRZI encoding/decoding, Bit stuffing /de-stuffing, supporting USB 2.0 test modes, and serial/parallel conversion.

#### 5.1.6 USPORT logic

USPORT implements the upstream port logic defined in section 11.6 of *USB specification Revision 2.0*. It mainly manipulates traffics in the upstream direction. The main functions include the state machines of Receiver and Transmitter, interfaces between UTMI and SIE, and traffic control to/from the REPEATER and TT.

#### **5.1.7 SIE (Serial Interface Engine)**

SIE handles the USB protocol defined in chapter 8 of *USB specification Revision 2.0*. It co-works with Mc to play the role of the hub kernel. The main functions of SIE include the state machine of USB protocol flow, CRC check, PID error check, and timeout check. Unlike USB 1.1, bit stuffing/de-stuffing is implemented in UTMI, not in SIE.

#### 5.1.8 Control/Status register

Control/Status register is the interface register between hardware and firmware. This register contains the information necessary to control endpoint0 and endpoint1 pipelines. Through the firmware based architecture, GL850A possesses higher flexibility to control the USB protocol easily and correctly.

#### **5.1.9 REPEATER**

Repeater logic implements the control logic defined in section 11.4 and section 11.7 of *USB specification Revision 2.0*. REPEATER controls the traffic flow when upstream port and downstream port are signaling in the same speed. In addition, REPEATER will generate internal resume signal whenever a wakeup event is issued under the situation that hub is globally suspended.

### **5.1.10. TT (Transaction Translator)**

TT implements the control logic defined in section 11.14 ~ 11.22 of USB specification Revision 2.0. TT basically handles the unbalanced traffic speed between the USPORT (operating in HS) and DSPORTS (operating in FS/LS) of hub. GL850A adopts the single TT architecture to provide the most cost effective solution. Single TT shares the same buffer control module for each downstream port. GL852 adopts multiple TT architecture to provide the most performance effective solution. Multiple TT provides control logics for each downstream port respectively. Please refer to GL852 datasheet for more detailed information.

#### 5.1.11 REPEATER/TT routing logic

REPEATER and TT are the major traffic control machines in the USB 2.0 hub. Under situation that USPORT and DSPORT are signaling in the same speed, REPEATER/TT routing logic switches the traffic channel to the REPEATER. Under situation that USPORT is in the high speed signaling and DSPORT is in the full/low speed signaling, REPEATER/TT routing logic switches the traffic channel to the TT.

#### 5.1.11.1 Connected to 1.1 Host/Hub

If an USB 2.0 hub is connected to the downstream port of an USB 1.1 host/hub, it will operate in USB 1.1 mode. For an USB 1.1 hub, both upstream direction traffic and downstream direction traffic are passing through REPEATER. That is, the REPEATER/TT routing logic will route the traffic channel to the REPEATER.

Figure 5.1 – Operating in USB 1.1 scheme

#### 5.1.11.2 Connected to USB 2.0 Host/Hub

If an USB 2.0 hub is connected to an USB 2.0 host/hub, it will operate in USB 2.0 mode. The upstream port signaling is in high speed with bandwidth of 480 Mbps under this environment. The traffic channel will then be routed to the REPEATER when the device connected to the downstream port is signaling also in high speed. On the other hand, the traffic channel will then be routed to TT when the device connected to the downstream port is signaling in full/low speed.

Figure 5.2 – Operating in USB 2.0 scheme

#### **5.12 DSPORT logic**

DSPORT (downstream port) logic implements the control logic defined in section 11.5 of *USB specification Revision 2.0*. It mainly manipulates the state machine, the connection/disconnection detection, over current detection and power enable control, and the status LED control of the downstream port. Besides, it also output the control signals to the DSPORT transceiver.

#### **5.13 DSPORT Transceiver**

DSPORT transceiver is the analog circuit that supports high-speed, full-speed, and low-speed electrical characteristics defined in chapter 7 of *USB specification Revision 2.0*. In addition, each DSPORT transceiver accurately controls its own squelch level to detect the detachment and attachment of devices.

#### 5.2 Configuration and I/O Settings

#### 5.2.1 RESET# Setting

GL850A integrates in the pull-up  $1.5K\Omega$  resister of the upstream port. When RESET# is enabled, the internal  $1.5K\Omega$  pull-up resister will be disconnected to the 3.3V power. To meet the requirement (p.141) of the USB 2.0 specification, pull-up resister should be disconnected while lacking of USB cable power (Vbus). Therefore, we suggest designing the RESET# circuit as following figure to meet the requirement mentioned above.

Figure 5.3 – RESET# (External Reset) setting and application

GL850A internally contains a power on reset circuit. The power on sequence is depicted in the next picture. To fully control the reset process of GL850A, we suggest the reset time applied in the external reset circuit should longer than that of the internal reset circuit.

Figure 5.4 – Power on sequence of GL850A

#### 5.2.2 PGANG/SUSPND Setting

To save pin count, GL850A uses the same pin to decide individual/gang mode as well as to output the suspend flag. The individual/gang mode is decided within 20us after power on reset. Then, about 50ms later, this pin is changed to output mode. GL850A outputs the suspend flag once it is globally suspended. For individual mode, a pull low resister greater than  $100 K\Omega$  should be placed. For gang mode, a pull high resister greater than  $100 K\Omega$  should be placed. In figure 5.6, we also depict the suspend LED indicator schematics. It should be noticed that the polarity of LED must be followed, otherwise the suspend current will be over spec limitation (2.5mA).

Figure 5.5 – Timing of PGANG/SUSPND strapping

Figure 5.6 – GANG Mode Setting

#### **5.2.3 SELF/BUS Power Setting**

GL850A can operate under bus power and conform to the power consumption limitation completely (suspend current < 2.5 mA, normal operation current < 100 mA). By setting PSELF, GL850A can be configured as a bus-power or a self-power hub.

Figure 5.7 – SELF/BUS Power Setting

#### **5.2.4 LED Connections**

GL850A controls the LED lighting according to the flow defined in section 11.5.3 of *Universal Serial Bus Specification Revision2.0*. Both manual mode and Automatic mode are supported in GL850A. When GL850A is globally suspended, GL850A will turn off the LED to save power.

Figure 5.8 – LED Connection

### 5.2.5 EEPROM Setting

GL850A replies to host commands by the default settings in the internal ROM. GL850A also offers the ability to reply to the host according to the settings in the external EEPROM(93C46). The following table shows the configuration of 93C46.

### Table 5.1 – 93C46 Configuration

#### **Unit: Byte**

| 70h | SERIAL<br>NUMBER<br>LENGTH | NUMBER  |       |       |        |     |                     |                |          |    |    |    |    |    |    |     |
|     |                            |         |       |       |        |     |                     |                |          |    |    |    |    |    |    |     |

Note: 1. VID\_H/VID\_L: high/low byte of VID value

- 2. PID\_H/PID\_L: high/low byte of PID value
- 3. CHKSUM: CHKSUM must equal to VID\_H + VID\_L + PID\_H + PID\_L + 1,otherwise firmware will ignore the EEPROM settings.
- 4. PORT\_NO: port number, value must be 1~4.
- 5. MaxPower : Describe the maximum power consumption, range=0Ma  $\sim$  500Ma . Value  $\sim$  00H $\sim$ FAH (unit = 2Ma)
- 6. DEVICE REMOVALBE:

|   |   |   | PORT4 | PORT3     | PORT2     | PORT1     |           |   |
|---|---|---|-------|-----------|-----------|-----------|-----------|---|
| - | - | - | -     | REMOVABLE | REMOVABLE | REMOVABLE | REMOVABLE | - |

- 0: Device attached to this port is removable.
- 1: Device attached to this port is non-removable.
- 7. VENDOR LENGTH: offset 10h contains the length of the vendor string. Values of vendor string is contained from 11h~3Fh.
- 8. PRODUCT LENGTH: offset 40h contains the length of product string. Values of product string is contained from 41h~6Fh.
- 9. SERIAL NUMBER LENGTH: offset 70h contains the value of serial number string. Values of serial number string is contained after offset 71h.

The schematics between GL850A and 93C46 is depicted in the following figures:

Figure 5.9 - Schematics Between GL850A and 93C46

GL850A firstly verifies the check sum after power on reset. If the check sum is correct, GL850A will take the configuration of 93C46 as part of the descriptor contents. To prevent the content of 93C46 from being over-written, amber LED will be disabled when 93C46 exists.

## CHAPTER 6 ELECTRICAL CHARACTERISTICS

## **6.1 Maximum Ratings**

**Table 6.1 – Maximum Ratings** 

| Symbol             | Parameter  | Min.           | Max.  | Unit |
|--------------------|--|----------------|-------|------|
| $V_{CC}$           | Power Supply   | -0.5           | +3.6  | V    |
| $V_{IN}$           | Input Voltage for digital I/O(EE_DO) pins                | -0.5           | +3.6  | V    |
| $V_{IN}$           | Input Voltage for digital I/O(Ovcur1-4,Pself,Reset) pins | -0.5           | +5.25 | V    |
| V <sub>INUSB</sub> | Input Voltage for USB signal (DP, DM) pins               | -0.5 +3.6 V    |       | V    |
| $T_S$              | Storage Temperature under bias                           | -60            | +100  | °C   |
| Fosc               | Frequency  | 12 MHz ± 0.05% |       | 5%   |

# **6.2 Operating Ranges**

**Table 6.2 – Operating Ranges** 

| Symbol             | Parameter                                  | Min. | Тур. | Max. | Unit |

<sup>\*2:</sup> F: Full-Speed, H: High-Speed

### **CHAPTER 7 PACKAGE DIMENSION**

### NOTES :

- 1. DIMENSIONS DI AND EI DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. DI AND EI ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH.
- 2. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM b DIMENSION BY MORE THAN 0.08mm. DAMBAR CAN NOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND AN ADJACENT LEAD IS 0.07mm.
